QUESTION 41 You are adding a new REST service endpoint to the FlightDataController controller. It returns flights from the consolidated data sources only for flights that are late. You need to write a LINQ to Entities query to extract the required data. Which code segment should you use?

```
^ A var historical = LoadHistorical();
var query = _Context.FlightInfo.AsQueryable()
    .Join(historical, x => x.Flight, y => y.Flight, (x, y) => new { Current = x,
    Historical = y })
    .Where(x => x.Historical.WasLate)
    .Select(x => x.Current);

^ B var historical = LoadHistorical();
var query = _Context.FlightInfo.AsEnumerable()
    .Where(x => historical.All(y => y.WasLate && x.Flight == y.Flight))
    .Select(x => x);

^ C var query = _Context.FlightInfo.AsQueryable()
    .Where(x => historical.Select(y => y.Flight).Contains(x.Flight))
    .Where(x => historical.Any(y => y.WasLate))
    .Select(x => x);

^ D var historical = LoadHistorical();
var query = _Context.FlightInfo.AsEnumerable()
    .Join(historical, x => x.Flight, y => y.Flight, (x, y) => new { Current = x,
    Historical = y })
    .Where(x => x.Historical.WasLate)
    .Select(x => x.Current);
```

A. Option AB. Option BC. Option CD. Option D Answer: D Explanation: D is right because you send result as REST so if you use "AsQueryable" the result is deferred to the next enumeration of your result. D is not optimized but will works. A will break at runtime. Credits to Rem QUESTION 42 Data provided by Consolidated Messenger is cached in the HttpContext.Cache object. You need to ensure that the cache is correctly updated when new data arrives. What should you do? A. Ensure that the EffectivePrivateBytesLimit value is greater than the size of the database file. B. Change the sliding expiration of the cache item to 12 hours. C. Use the SqlCacheDependency type configured with a connection string to the database file. D. Use the CacheDependency type configured to monitor the SFTP target folder. Answer: D QUESTION 43 You need to load flight information provided by Consolidated Messenger. Which should you use? A. SQL Server Data Transformation Services (DTS) B.

EntityTransaction and EntityCommandC. Office Open XMLD. OleDbConnection and OleDbDataReader Answer: D
QUESTION 44 Drag and Drop Question You need to parse flight information from Blue Yonder Airlines. The content of the XML file is shown below.

```
<?xml version="1.0" encoding="utf-8"?>
<AirlineFeed>
  <Flight xmlns="urn:CFI" name="AS515">
    <Seats>123</Seats>
    <Arrival>5/2/2011 12:01:13</Arrival>
  </Flight>
  <Flight xmlns="urn:CFI" name="AS124">
    <Arrival>5/1/2012 10:17:57 PM +02:00</Arrival>
  </Flight>
  <FlightManifest>
    ...
  </FlightManifest>
</AirlineFeed>
```

Some airlines do not specify the timezone of the arrival time. If the timezone is not specified, then it should be interpreted per the business requirements. You need to implement the LoadFlights() and Parse() methods of the BlueYonderLoader class. What should you do? (To answer, drag the appropriate code segments to the correct location in the answer area. Each segment may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.)

```
var flights = feed.Elements(
    feed.Root.GetPrefixOfNamespace("urn:CFI"));

var flights = feed.Descendants().Where(x =>
    x.NodeType != XmlNodeType.XmlDeclaration
    "Flight");

var flights = feed.Descendants("urn:CFI:Flight")
    .Concat(feed.Descendants("Flight"));

fi.Arrival = DateTimeOffset.Parse(arrivalRaw,
    null, System.Globalization.DateTimeStyles
    ...);

fi.Arrival = DateTimeOffset.Parse(arrivalRaw,
    null, System.Globalization.DateTimeStyles
    ...);

fi.Arrival = XmlConvert.ToDateTimeOffset(
    new[] { "Local", "Universal" });

public IEnumerable<FlightInfo> LoadFlights()
{
    ...
    return flights.Select(x => Parse(x));
}

private FlightInfo Parse(XElement flightElement)
{
    var fi = new FlightInfo();
    fi.Flight = flightElement.Attribute("name").Value;
    var arrivalRaw = flightElement.Element("Arrival").Value;

    fi.Seats = XmlConvert.ToInt32(flightElement.Element("Seats").Value);
    return fi;
}
```

Answer:

```
var flights = feed.Elements(  
    feed.Root.GetPrefixOfNamespace("{urn:CFI}") + "Flight");  
  
var flights = feed.Descendants().Where(x =>  
    x.NodeType != XmlNodeType.XmlDeclaration && (string)x ==  
    "Flight");  
  
var flights = feed.Descendants("{urn:CFI}Flight")  
    .Concat(feed.Descendants("Flight"));  
  
fi.Arrival = DateTimeOffset.Parse(arrivalRaw,  
    null, System.Globalization.DateTimeStyles.AssumeUniversal);  
  
fi.Arrival = DateTimeOffset.Parse(arrivalRaw,  
    null, System.Globalization.DateTimeStyles.AdjustToUniversal);  
  
fi.Arrival = XmlConvert.ToDateTimeOffset(arrivalRaw,  
    new[] { "Local", "Universal" });  
  
public IEnumerable<FlightInfo> LoadFlights(XDocument feed)  
{  
    var flights = feed.Descendants("{urn:CFI}Flight")  
        .Concat(feed.Descendants("Flight"));  
  
    return flights.Select(x => Parse(x));  
}  
  
private FlightInfo Parse(XElement flightElement)  
{  
    var fi = new FlightInfo();  
    fi.Flight = flightElement.Attribute("name").Value;  
    var arrivalRaw = flightElement.Element("Arrival").Value;  
  
    fi.Arrival = DateTimeOffset.Parse(arrivalRaw,  
        null, System.Globalization.DateTimeStyles.AssumeUniversal);  
  
    fi.Seats = XmlConvert.ToInt32(flightElement.Element("Seats").Value);  
    return fi;  
}
```

QUESTION 45 You are adding a new REST service endpoint to the FlightDataController controller that returns the total number of seats for each airline. You need to write a LINQ to Entities query to extract the required data. Which code segment should you use? A. B. C. D.

A. Option AB. Option BC. Option CD. Option D Answer: D QUESTION 46 Historical flight information data will be stored in Windows Azure Table Storage using the FlightInfo class as the table entity. There are millions of entries in the table. Queries for historical flight information specify a set of airlines to search and whether the query should return only late flights. Results should be

ordered by flight name. You need to specify which properties of the FlightInfo class should be used at the partition and row keys to ensure that query results are returned as quickly as possible. What should you do? (Each correct answer presents part of the solution. Choose all that apply.) A. Use the WasLate property as the row key.B. Use the Airline property as the row key.C. Use the WasLate property as the partition keyD. Use the Arrival property as the row key.E. Use the Airline property as the partition key. F. Use the Flight property as the row key. Answer: EF QUESTION 47

Transformed historical flight information provided by the RemoteDataStream() method must be written to the response stream as a series of XML elements named Flight within a root element named Flights. Each Flight element has a child element named FlightName that contains the flight name that starts with the two-letter airline prefix. You need to implement the StreamHistoricalFlights() method so that it minimizes the amount of memory allocated. Which code segment should you use as the body of the StreamHistoricalFlights() method in the HistoricalDataLoader.es file?

```
A responseWriter.WriteStartElement("Flights");
var flights = RemoteDataStream()
.OrderBy(x => GetAirline(x.Element("FlightName")))
var filteredFlights = flights
.SkipWhile(x => GetAirline(x.Element("FlightName")) != airline);
foreach (var f in filteredFlights)
{
    var flight = ConvertToHistoricalFlight(f);
    flight.WriteTo(responseWriter);
}
responseWriter.WriteEndElement();

B responseWriter.WriteStartElement("Flights");
var flights = RemoteDataStream().Select(x =>
{
    if (GetAirline(x) == airline)
    {
        return ConvertToHistoricalFlight(x);
    }
});
flights.TakeWhile(x =>
{
    x.WriteTo(responseWriter);
    return x != null;
});
responseWriter.WriteEndElement();

C var data = RemoteDataStream().ToDictionary(x =>
GetAirline(x.Element("FlightName")),
x => new XElement("Flights", ConvertToHistoricalFlight(x).Descendants()));
data[airline].WriteTo(responseWriter);

D var flights = new XElement("Flights",
from flight in RemoteDataStream()
where GetAirline(flight.Element("FlightName")) == airline
select ConvertToHistoricalFlight(flight));
flights.WriteTo(responseWriter);
```

A. Option AB. Option BC. Option CD. Option D Answer: DE Explanation:

<http://msdn.microsoft.com/en-us/library/system.xml.linq.xstreamingelement.aspx>

<http://msdn.microsoft.com/en-us/library/bb551307.aspx>

QUESTION 48 Errors occasionally occur when saving data using the FlightInfoContext ADO.NET Entity Framework context. Updates to the data are being lost when an error occurs. You need to ensure that data is still saved when an error occurs by retrying the operation. No more than five retries should be performed. With which code segment should you replace the body of the SaveChanges() method in the FlightInfoContext.es file?

```
A var result = FlightInfo.SqlQuery("UPDATE WITH RETRY", FlightInfo);
if (result.Count() > 0)
{
    result.AsOfTracking();
    return -1;
}
return 0;

B try
{
    return base.SaveChanges();
}
catch (EntityCommandExecutionException ex)
{
    if (ex.Data.Keys.Cast<int>().Any(x => IsTransient(x)))
    {
        return 5 + SaveChanges();
    }
    return -1;
}

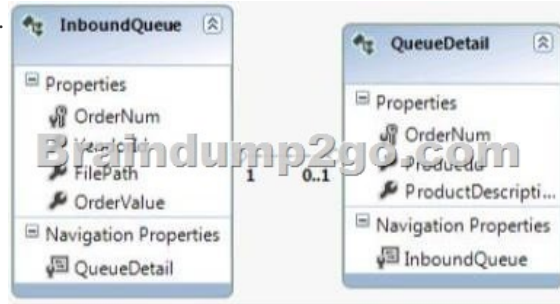

C for (var i = 0; i < 5; i++)
{
    try
    {
        return base.SaveChanges();
    }
    catch (EntityCommandExecutionException ex)
    {
        if (IsTransient(ex.Number))
        {
            continue;
        }
    }
}
return base.SaveChanges();

D var exception = new EntitySqlException();
while (exception != null && exception.Data.Count < 5)
{
    try
    {
        return base.SaveChanges();
    }
    catch (EntitySqlException ex)
    {
        if (IsTransient(ex.Result))
        {
            exception = ex;
        }
    }
}
return base.SaveChanges();
```

A. Option AB. Option BC. Option CD. Option D Answer: CE Explanation: EntitySqlException: Represents errors that occur when parsing Entity SQL command text. This exception is thrown when syntactic or semantic rules are violated. SqlException: The exception that is thrown when SQL Server returns a warning or error. This class cannot be inherited.

EntityCommandExecutionException : Represents errors that occur when the underlying storage provider could not execute the specified command. This exception usually wraps a provider-specific exception. Case Study 2 - ASP.NET MVC (QUESTION 49 -

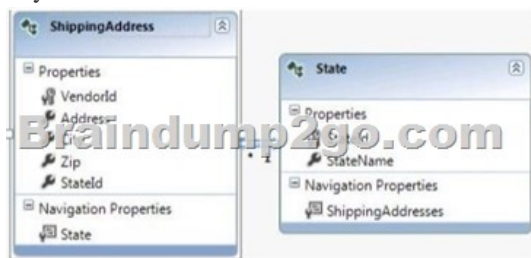

QUESTION 63)BackgroundYou are developing an ASP.NET MVC application in Visual Studio 2012 that will be used to process orders.Business RequirementsThe application contains the following three pages.- A page that queries an external database for orders that are ready to be processed. The user can then process the order.- A page to view processed orders.- A page to view vendor information.The application consumes three WCF services to retrieve external data.Technical RequirementsVisual Studio Solution: The solution contains the following four projects.- ExternalQueue: A WCF service project used to communicate with the external order database.- OrderProcessor: An ASP.NET MVC project used for order processing and logging order metadata.- OrderUpload: A WCF service project used to submit order data to an external data source.- Shipping: A WCF service project used to acquire shipping information.ExternalQueue Project:Entity Framework is used for data access. The entities are defined in the ExternalOrders.edmx file as shown in the following diagram.

The project contains two services defined in the following files.- IExternalQueueService.es- ExternalQueueService.svc.The ExternalQueue.Helpers namespace contains a definition for a class named OrderNotFound Exception.OrderProcessor Project:Entity Framework is used for data access. The entities are defined in the ProcessedOrders.edmx file as shown in the following diagram.

The classes are contained in the OrderProcessor.Entities namespace. The project contains the following two controllers.- InboundQueueController.es- ProcessedOrderController.esWCF service proxies to the ExternalQueue, Shipping and OrderUpload services have been generated by using the command prompt. The ExecuteCommandProcedure() method in the ExternalQueueService.svc file must run asynchronously. The ProcessedOrderController controller has the following requirements. The GetVendorPolicy() method must enforce a 10 minute absolute cache expiration policy. The GetProcessedOrders() method must return a view of the 10 most recently processed orders.OrderUpload Project:The project contains two services defined in the following files.- IUploadCallbackService.es- UploadCallbackService.svcData Access is maintained in a file named UploadOrder.es. Shipping Project:Entity Framework is used for data access. The entities are defined in the ExternalOrders.edmx file as shown in the following diagram.

The Custom Tool property for ExternalOrders.edmx has been removed. POCO classes for the Entity Model are located in the ShippingAddress.es file. The POCO entity must be loaded by using lazy loading. The project contains two services defined in the following files.- IShippingService.es- ShippingService.svc.The IShippingService contract must contain an operation that receives an order number as a parameter. The operation must return a class named ShippingInfo that inherits from a class named State.

QUESTION 49 The QueueDetail entity type must inherit from the InboundQueue entity type in the ExternalQueue service project using table-per-type inheritance. You need to modify the entities in the designer. What should you do? (Each correct answer presents part of the solution. Choose all that apply.) A. Remove the OrderNum property in InboundQueue. B. Remove the OrderNum property in QueueDetail. C. Set the QueueDetail BaseType to InboundQueue. D. Remove the association between the entities. E. Right-click the entities and validate the table mapping. F. Set the InboundQueue BaseType to QueueDetail. Answer: BCDE

Explanation: <http://www.robbagby.com/entity-framework/entity-framework-modeling-table-per-type-inheritance/> QUESTION 50

Drag and Drop Question The GetVendorPolicy() private method in the ProcessedOrderController controller is returning a CacheItemPolicy object with default values. The returned policy must expire if the external file located at C:\TriggersVendorTrigger.txt has been modified or the timeout outlined in the technical requirements is reached. You need to return the policy. How should you build the method? (To answer, drag the appropriate code segments to the correct location or locations in the answer area. Each code segment may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.)

The screenshot shows an exam question interface. On the left, there is a list of code segments to be dragged: Priority, ChangeMonitors, AbsoluteExpiration, Expires, DateTime.Now.AddMinutes, and another DateTime.Now.AddMinutes. On the right, the 'Answer Area' contains the following C# code:

```
private CacheItemPolicy GetVendorPolicy()
{
    CacheItemPolicy vendorPolicy = new CacheItemPolicy();
    vendorPolicy. [ ]
    vendorPolicy. [ ]
    .Add(new HostFileChangeMonitor(GetTriggerPaths()));
    return vendorPolicy;
}
```

Answer:

```
private CacheItemPolicy GetVendorPolicy()
{
    CacheItemPolicy vendorPolicy = new CacheItemPolicy();
    vendorPolicy.AbsoluteExpiration = DateTime.Now.AddMinutes(10);
    vendorPolicy.ChangeMonitors = new Monitor[] {
        new HostFileChangeMonitor(GetTriggerPaths())
    };
    return vendorPolicy;
}
```
